

Homework Two

Nathan Rose

February 10, 2022

1. A system is described by

$$\dot{x} = \begin{bmatrix} -2 & 1 \\ -1 & 0 \end{bmatrix} x + \begin{bmatrix} 3 \\ 1 \end{bmatrix} u \quad (1)$$

Obtain the STM of the uncontrolled system using the following methods:

- (a) Via taking the laplace inverse of $(sI - A)^{-1}$

$$(sI - A) = \begin{bmatrix} s+2 & -1 \\ 1 & s \end{bmatrix} \quad (2)$$

$$(sI - A)^{-1} = \begin{bmatrix} \frac{s}{s^2+2s+1} & \frac{1}{s^2+2s+1} \\ -\frac{1}{s^2+2s+1} & \frac{s+2}{s^2+2s+1} \end{bmatrix} \quad (3)$$

$$\mathcal{L}^{-1}\left((sI - A)^{-1}\right) = \begin{bmatrix} (1-t)e^{-t}\theta(t) & te^{-t}\theta(t) \\ -te^{-t}\theta(t) & (t+1)e^{-t}\theta(t) \end{bmatrix} \quad (4)$$

The theta in the equation is the step function as described here

This is accomplished with the code in Appendix A

- (b) Via model decomposition of Matrix A

Eigenvalues are: $\lambda = -1, -1$ This is not the simple case... joy

$$(A - \lambda_i I)v_i = 0 \quad (5)$$

$$\begin{bmatrix} -1 & 1 \\ -1 & 1 \end{bmatrix} v_i = 0 \quad (6)$$

only one solution :/

$$0 = \begin{bmatrix} -1 & 1 \\ -1 & 1 \end{bmatrix}^2 v_2 = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} v_2 \quad (7)$$

$$v_2 = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \quad (8)$$

$$v_1 = \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} v_2 = \begin{bmatrix} -1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \end{bmatrix} \quad (9)$$

$$V = \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix}, J = \begin{bmatrix} -1 & 1 \\ 0 & -1 \end{bmatrix} \quad (10)$$

$$\Lambda = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}, N = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \quad (11)$$

$$e^{\Lambda t} = \begin{bmatrix} e^{-t} & 0 \\ 0 & e^{-t} \end{bmatrix} \quad (12)$$

$$e^{Nt} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & t \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & t \\ 0 & 1 \end{bmatrix} \quad (13)$$

$$Ve^{\Lambda t}e^{Nt}V^{-1} = \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} e^{-t} & 0 \\ 0 & e^{-t} \end{bmatrix} \begin{bmatrix} 1 & t \\ 0 & 1 \end{bmatrix} \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix}^{-1} \quad (14)$$

$$Ve^{\Lambda t}e^{Nt}V^{-1} = \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} e^{-t} & te^{-t} \\ 0 & e^{-t} \end{bmatrix} \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix}^{-1} \quad (15)$$

insert some python to solve this multiplication

$$\Phi(t) = Ve^{\Lambda t}e^{Nt}V^{-1} = \begin{bmatrix} e^{-t}(1-t) & e^{-t}t \\ -e^{-t}t & e^{-t}(t+1) \end{bmatrix}' \quad (16)$$

(c) Via the Cayley-Hamilton theorem

This will be done by using the Cayley-hamilton theorem to solve for e^{At} then via equation 22 it is the STM

- Find the characteristic polynomial

$$0 = |\lambda I - A| = \begin{vmatrix} \lambda + 2 & -1 \\ 1 & \lambda \end{vmatrix} = \lambda^2 + 2\lambda + 1 \quad (17)$$

$$\lambda = -1, -1 \quad (18)$$

- solve for β_0 and β_1

$$e^{-t} = \beta_0 - \beta_1 \quad (19)$$

$$te^{-t} = \beta_1 \quad (20)$$

$$e^{-t} = \beta_0 - te^{-t} \quad (21)$$

$$\beta_0 = e^{-t} + te^{-t} \quad (22)$$

- solve e^{At} (and STM)

$$STM = e^{At} = \beta_0 I + \beta_1 A = \begin{bmatrix} e^{-t} - te^{-t} & te^{-t} \\ -te^{-t} & te^{-t} + e^{-t} \end{bmatrix} \quad (23)$$

2. In the system in Problem 1,

- (a) Obtain the zero input solution $x_{Z1}(t)$ for the initial condition $\bar{x}(0) = \begin{bmatrix} 10 \\ 1 \end{bmatrix}$

$$x(t) = STM(t)x_0 \quad (24)$$

$$x(t) = \begin{bmatrix} (10 - 9t) e^{-t} \theta(t) \\ (1 - 9t) e^{-t} \theta(t) \end{bmatrix} \quad (25)$$

- (b) Obtain the zero state solution $x_{ZS}(t)$ for input $u(t) = e^{2t}$ for $t > 0$
o

$$x_{zs}(t) = \int_{t_0}^t \Phi(t, \tau) B(\tau) u(\tau) d\tau \quad (26)$$

$$x_{zs}(t) = \int_0^t \begin{bmatrix} (2\tau - 2t + 3) e^{3\tau-t} \theta(-\tau + t) \\ (2\tau - 2t + 1) e^{3\tau-t} \theta(-\tau + t) \end{bmatrix} d\tau \quad (27)$$

$$x_{zs}(t) = \begin{bmatrix} \frac{(6t+7e^{3t}-7)e^{-t}\theta(t)}{9} \\ \frac{(6t+e^{3t}-1)e^{-t}\theta(t)}{9} \end{bmatrix} \quad (28)$$

- (c) Obtain the total solution $\bar{x}(t)$ for the initial conditions and input in 2a and 2b.

Because this is an LTI system, the super-position property applies and the results of both of these systems can be added together to produce a system with initial state of 2a and the input of 2b

$$x(t) = \begin{bmatrix} \frac{(-75t+7e^{3t}+83)e^{-t}\theta(t)}{9} \\ \frac{(-75t+e^{3t}+8)e^{-t}\theta(t)}{9} \end{bmatrix} \quad (29)$$

3. Given

$$A = \begin{bmatrix} -5 & -6 & 0 \\ 2 & 2 & 0 \\ 0 & 0 & -3 \end{bmatrix} \quad (30)$$

(a) Find A^{-1} using the Cayley-Hamilton theorem

$$\Delta(\lambda) = (\lambda I - A) = 0 \quad (31)$$

$$\lambda = -1, -2, -3 \quad (32)$$

$$f(\lambda) = \beta_0 + \beta_1\lambda + \beta_2\lambda^2 \quad (33)$$

$$\begin{bmatrix} -1 \\ -\frac{1}{2} \\ -\frac{1}{3} \end{bmatrix} = \begin{bmatrix} 1 & -1 & 1 \\ 1 & -2 & 4 \\ 1 & -3 & 9 \end{bmatrix}^{-1} \begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \end{bmatrix} \quad (34)$$

$$\begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \end{bmatrix} = \begin{bmatrix} -\frac{11}{6} \\ -1 \\ -\frac{1}{6} \end{bmatrix} \quad (35)$$

$$A^{-1} = \begin{bmatrix} 1 & 3 & 0 \\ -1 & -\frac{5}{2} & 0 \\ 0 & 0 & -\frac{1}{3} \end{bmatrix} \quad (36)$$

(b) Obtain e^{At} using one of the three mentioned methods in Problem 1
I am using using the laplace transform method.

$$\mathcal{L}^{-1}\left((sI - A)^{-1}\right) = \begin{bmatrix} (4 - 3e^t) e^{-2t}\theta(t) & 6(1 - e^t) e^{-2t}\theta(t) & 0 \\ 2(e^t - 1) e^{-2t}\theta(t) & (4e^t - 3) e^{-2t}\theta(t) & 0 \\ 0 & 0 & e^{-3t}\theta(t) \end{bmatrix} \quad (37)$$

4. Let the STM of the system $\dot{\bar{x}}(t) = A\bar{x}(t)$, where A is a constant matrix, be $\Phi(t, t_0)$. Also, let the STM of the system $\dot{\bar{z}}(t) = -A^T \bar{z}(t)$, where A^T is the transpose of A , be $\Theta(t, t_0)$. Use the properties of the STM on Slide 39 to show that $\Theta(t, t_0) = \Phi^T(t_0, t)$.

$$\Theta(t, t_0) = \Phi^T(t, t_0) \quad (38)$$

$$\Theta(t, t_0) = (\psi(t)\psi^{-1}(t_0))^T \quad (39)$$

$$\Theta(t, t_0) = \psi^{-1}(t_0)^T \psi(t)^T \quad (40)$$

$$\Theta(t, t_0) = \psi(t_0)^T \psi^{-1}(t)^T \quad (41)$$

$$\Theta(t, t_0) = \Theta(t_0, t) \quad (42)$$

5. Given a system in state space

$$\dot{\bar{x}}(t) = A\bar{x}(t) + B\bar{u}(t) \quad (43)$$

$$\bar{y}(t) = C\bar{x}(t) + D\bar{u}(t) \quad (44)$$

prove that the transfer function matrix is invariant to any similarity transformation of the state i.e. $\bar{x} = T\bar{z}$, where T is a constant invertible matrix.

$$\dot{x} = Ax + Bu \quad (45)$$

$$T\dot{z} = ATz + Bu \quad (46)$$

$$\dot{z} = T^{-1}ATz + T^{-1}Bu \quad (47)$$

$$A_Z = T^{-1}AT, B_Z = T^{-1}B \quad (48)$$

$$C_Z = CT^{-1}, D_Z = D \quad (49)$$

$$\mathcal{L}^{-1}(C(sI - A)^{-1}B + D) \quad (50)$$

$$\mathcal{L}^{-1}(C_Z(sI - A_Z)^{-1}B_Z + D_Z) \quad (51)$$

$$\mathcal{L}^{-1}(CT^{-1}(sI - T^{-1}AT)^{-1}T^{-1}B + D) \quad (52)$$

$$\mathcal{L}^{-1}(CT^{-1}T(sI - A)^{-1}TT^{-1}B + D) \quad (53)$$

$$\mathcal{L}^{-1}(C(sI - A)^{-1}B + D) \quad (54)$$

equality!

6. Give the algebraic and geometric multiplicities of the repeated eigenvalue and find e^{3t} for the matrices below.

(a) $J = \begin{bmatrix} \lambda & 1 \\ 0 & \lambda \end{bmatrix}$

algebraic multiplicity: 2

geometric multiplicity: 2

(b) $J = \begin{bmatrix} \lambda & 1 & 0 \\ 0 & \lambda & 1 \\ 0 & 0 & \lambda \end{bmatrix}$

algebraic multiplicity: 3

geometric multiplicity: 3

(c) $J = \begin{bmatrix} \lambda & 1 & 0 \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{bmatrix}$

algebraic multiplicity: 3

geometric multiplicity: 2

A One A source code
